 Many slides have been borrowed from the official lecture slides accompanying the textbook:

Database System Concepts, (2019), Seventh Edition,

Avi Silberschatz, Henry F. Korth, S. Sudarshan

McGraw-Hill, ISBN 9780078022159

The original lecture slides are available at:

https://www.db-book.com/

 Some of the slides have been borrowed from the lectures by Dr. Immanuel Trummer (Cornell University). Available at: (<u>www.itrummer.org</u>)

Outline: Week 8

- SQL: Nested Sub-queries
 - Subqueries in the WHERE Clause
 - Subqueries in the FROM Clause
 - Subqueries in the SELECT Clause

Utilizing Relational DBMS: Lifecycle

- Design relational schema
- Populate tables/relations
- Write queries to get information back from tables

Structured Query Language (SQL)

- The standard to access/retrieve/manipulate data in a relational database
- Examples of a Data Definition Language (DDL) Component

```
create table department
(dept_name char (20),
building char (15),
budget numeric (12,2));
```

Examples of a Data Manipulation Language (DML) Component

```
select instructor.name
from instructor
where instructor.dept_name = 'History';
```

Figure 4.2 The takes relation.

Structured Query Language (SQL)

- The standard to access/retrieve/manipulate data in a relational database
- Examples of a Data Definition Language (DDL) Component

```
create_table department
(dept_name char (20),
building char (15),
budget numeric (12,2));
```

Examples of a Data Manipulation Language (DML) Component

```
select instructor.name
from instructor
where instructor.dept_name = 'History';
```

SQL: Data Manipulation

- Basic query structure
- Major clauses in an SQL query
 - SELECT
 - FROM
 - WHERE
 - GROUP BY
 - HAVING

Remember: Order of Execution in SQL Queries

In general, the meaning of an SQL query can be understood as follows:

- Generate a Cartesian product of the relations listed in the from clause.
- Apply the predicates specified in the where clause on the result of Step 1.
- For each tuple in the result of Step 2, output the attributes (or results of expressions) specified in the select clause.

Remember: Updated Order of Execution in SQL Queries

The meaning of a query containing aggregation, **group by**, or **having** clauses is defined by the following sequence of operations:

- 1. As was the case for queries without aggregation, the **from** clause is first evaluated to get a relation.
- 2. If a where clause is present, the predicate in the where clause is applied on the result relation of the from clause.
- 3. Tuples satisfying the **where** predicate are then placed into groups by the **group** by clause if it is present. If the **group** by clause is absent, the entire set of tuples satisfying the **where** predicate is treated as being in one group.
- 4. The **having** clause, if it is present, is applied to each group; the groups that do not satisfy the **having** clause predicate are removed.
- 5. The **select** clause uses the remaining groups to generate tuples of the result of the query, applying the aggregate functions to get a single result tuple for each group.

Subqueries in SQL

- Subqueries in the WHERE Clause
- Subqueries in the FROM Clause
- Subqueries in the SELECT Clause

Subqueries in the WHERE Clause

- The common use of subqueries in the WHERE clause is to perform test:
 - For set membership
 - For set comparison
 - For set cardinality

Subqueries in the WHERE Clause: Test for Set Membership

Find courses offered in Fall 2017 and in Spring 2018

Find courses offered in Fall 2017 but not in Spring 2018

```
select distinct course_id

from section

where semester = 'Fall' and year= 2017 and

course_id not in (select course_id

from section

where semester = 'Spring' and year= 2018);
```

Subqueries in the WHERE Clause: Test for Set Membership

 Find the total number of (distinct) students who have taken course sections taught by the instructor with ID 10101

The *Case* Statement

The general form of the case statement is as follows:

```
case
when pred1 then result1
when pred2 then result2 ...
when predn then resultn
else
result0
end
```

- The operation returns result *i*, where *i* is the first of pred1, pred2, ..., predn that is satisfied; if none of the predicates is satisfied, the operation returns result0.
- Case statements can be used in any place where a value is expected

The *Case* Statement in SELECT Clause

select E.EmployeeID,

CASE
