 Many slides have been borrowed from the official lecture slides accompanying the textbook:

Database System Concepts, (2019), Seventh Edition,

Avi Silberschatz, Henry F. Korth, S. Sudarshan

McGraw-Hill, ISBN 9780078022159

The original lecture slides are available at:

https://www.db-book.com/

 Some of the slides have been borrowed from the lectures by Dr. Immanuel Trummer (Cornell University). Available at: (www.itrummer.org) Outline: Week 9

- SQL: Modification of the database
 - Deletion
 - Insertion
 - Update

Utilizing Relational DBMS: Lifecycle

- Design relational schema
- Populate tables/relations
- Write queries to get information back from tables

Structured Query Language (SQL)

- The standard to access/retrieve/manipulate data in a relational database
- Examples of a Data Definition Language (DDL) Component

```
create table department
(dept_name char (20),
building char (15),
budget numeric (12,2));
```

Examples of a Data Manipulation Language (DML) Component

```
select instructor.name
from instructor
where instructor.dept_name = 'History';
```

SQL: Modification of the Database

- Deletion
 - delete from
- Insertion
 - insert into
- Update
 - update

SQL expresses a deletion by:

delete from r where P

where r represents a relation and P represents a predicate

- The **delete** statement first finds all tuples *t* in *r* for which *P(t)* is *true* and then deletes them from *r*.
- The where clause can be omitted, in which case all tuples in r are deleted.

Delete all instructors

delete from instructor

Delete all instructors from the Finance department

delete from instructor
where dept_name= 'Finance';

Figure 2.1 The instructor relation.

- Problem: as we delete tuples from instructor, the average salary changes
- Solution used in SQL:
 - First, compute avg (salary) and find all tuples to delete
 - Next, delete all tuples found above (without recomputing avg or retesting the tuples)

Add a new tuple to course

insert into course
values ('CS-437', 'Database Systems', 'Comp. Sci.', 4);

course_id	title	dept_name	credits
BIO-101	Intro. to Biology	Biology	4

Figure 2.1 The instructor relation.

- The order is important
- Can be done better using the case statement (next slide)

SQL: Update with Case Statement

• Example: Increase salaries of instructors whose salary is over \$100,000 by 3%, and all others by a 5%

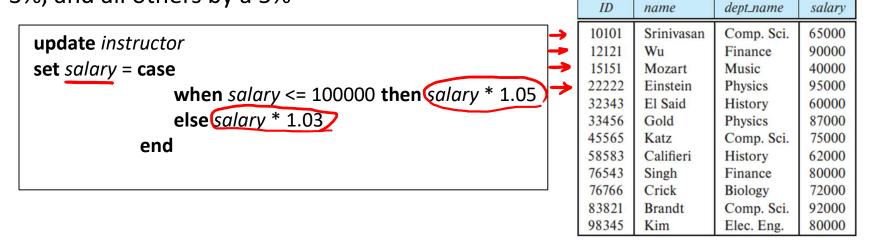

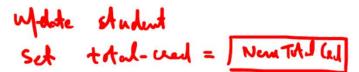

Figure 2.1 The instructor relation.

SQL: The Case Statement

The general form of the case statement is as follows:

```
case
when pred1 then result1
when pred2 then result2 ...
when predn then resultn
else
result0
end
```

- The operation returns result*i*, where *i* is the first of pred1, pred2, ..., predn that is satisfied; if none of the predicates is satisfied, the operation returns result0.
- Case statements can be used in any place where a value is expected

SQL: Updates with Scalar Subqueries

- Recompute and update tot_cred value for all students
 - Consider an update where we set the tot_cred attribute of each student tuple to the sum of the credits of courses successfully completed by the student. We assume that a course is successfully completed if the student has a grade that is neither 'F' nor null. To specify this update, we need to use a subquery in the set clause, as shown below:

ID	name	dept_name	tot_cred
00128	Zhang	Comp. Sci.	102
